ABSTRACT

5 A method and system are provided for facilitating a user-configurable delivery
and display of a body of text to a user (e.g., person) in a "stacked" manner. The method
includes accessing a document comprising a body of text interspersed with terminal
10 characters and which can be separated into a sequence of text groupings. The method
also includes retrieving an initial text grouping from the document, setting the initial text
grouping as a present text grouping, and displaying the present text grouping to a user for
a respective display duration, wherein the display duration is configurable by the user.
Responsive to not retrieving a terminal character, the method further includes retrieving
15 an immediately subsequent text grouping from the document, setting the immediately
subsequent text grouping as the present grouping, and repeating the displaying the present
text grouping, retrieving an immediately subsequent text grouping, and setting the
immediately subsequent text grouping until a terminal character is retrieved. The system
includes a text player operable to retrieve a text grouping from a document source and
20 display the text grouping for a respective display duration configurable by a user. The
text player is further operable to, in response to not retrieving a terminal character,
retrieve an immediately subsequent text grouping from the document source and display
the immediately subsequent text grouping in the display for a respective display duration
by replacing the previously displayed text grouping
